

Tools for Building ADMB with a 32-bit Compiler
Jon Schnute, Chris Grandin, and Rowan Haigh
December, 2013

We use files from the MinGW Project for 32-bit Windows, obtained from the site:

<http://sourceforge.net/projects/mingw/files/MSYS/Base/msys-core/>.

Download and run the file [mingw-get-setup.exe](#). This produces the "MinGW Installation Manager". Select "Basic Setup" and then select the following three packages:

mingw32-base, mingw32-gcc-g++, msys-base.

(Right-click, select <Mark for Installation>, then from the menu <Installation>, <Apply Changes>.) By default, this puts all software in the directory `C:\mingw`.

ADMBtools32-01 (version 1 for 32-bit Windows) uses the `mingw` tree obtained this way, except that the directory `mingw\msys\1.0` is eliminated and its contents are promoted to the parent directory `mingw\msys`.

The 64-bit toolkit for ADMB can also produce a 32-bit library. Eventually, it will replace this older toolkit for 32-bit Windows.
